

Complaint Register System

1. Introduction

The Complaint Management System is a simple C-based application designed to record, store, and manage complaints using **file handling** and **structures**. It allows users to register new complaints, view existing ones, and update their status. Each complaint is stored in a text file (complaints.txt) with details such as name, date, subject, description, place, contact number, and status.

This system demonstrates the practical use of:

- **Structs** for organizing complaint data.
- **File handling** for persistent storage.
- **Menu-driven programming** for user interaction.
- **Status updates** to track complaint progress.

2. System Architecture

Complaint Management System Flow

3. Data Structure Visualization

Field	Data Type	Description
id	Int	Unique complaint number
name	Char [50]	Complainant's name
complaint	Char [150]	Complaint title
date	Char [15]	Date of complaint
subject	Char [80]	Subject of complaint
issue	Char [500]	Detailed description
place	Char [50]	Place of incident
contact	Char [15]	Contact number
status	Char [20]	Complaint status (Pending/Closed/etc.)

4. Process Visualization

a) Register Complaint

- Input form (Name, Complaint, Date, Subject, Issue, Place, Contact).
- Status automatically set to **Pending**.
- Saved in complaints.txt.

b) View Complaints

- Reads all complaints from file.
- Displays them in structured format.
- Allows updating status:
 - Case Closed
 - Case Withdrawn
 - No Change
 - Case Was Success

5. File Visualization

Show how data is stored in complaints.txt (**OUTPUT**)

1 | Ravi | Phone Stolen | 03-12-2025 | Theft | Mobile phone stolen from market area | Nellore | 9012345678 | Pending

2 | Meena | Divorce Case | 04-12-2025 | Family Dispute | Seeking legal separation due to domestic issues | Nellore | 9988776655 | Case Withdrawn

3 | Kiran | Land Grabbing | 05-12-2025 | Property Dispute | Unauthorized occupation of ancestral land | Nellore | 9988776655 | Pending

6. Summary

- The system starts with a **menu** offering three options: Register Complaint, View Complaints, and Exit.
- **Register Complaint:** Collects user details and saves them to the file with status set to *Pending*.
- **View Complaints:** Displays all complaints from the file and allows updating their status (Closed, Withdrawn, Success, etc.).
- **Exit:** Ends the program after saving updates.
- Data is stored in a structured format using | separators, making it easy to read and update.
- The program highlights how C can be used for **real-world applications** like complaint tracking.

7. Results

The Complaint Management System successfully demonstrates how complaints can be registered, stored, viewed, and updated using C programming with file handling and structures.

- Complaint Registration

Each new complaint is assigned a unique ID.

Details such as name, date, subject, description, place, and contact are stored.

Status is automatically initialized as Pending.

- ***Complaint Viewing***

All complaints are displayed in a structured format.

Users can update the status (Case Closed, Case Withdrawn, No Change, Case Was Success).

- ***File Storage***

Complaints are saved in complaints.txt using a | separated format.

Updates overwrite the file, ensuring the latest status is preserved
